[Keygen HSMWorks 2005 Download](#)

3   Generate the public and private key files by running the following command. This uses the label of the key pair stored in the HSM, and constructs a DNS key pair for use by **named** and **dnssec-signzone**. The key files are created in the current working directory.

-   For 1-of-N OCS, softcard, and module protection:

```
# dnssec-keyfromlabel -l thales-bindtest-ZSK thales-bindtest.org
```

-   For K-of-N OCS protection:

```
# preload --module=<module_number> --cardset-name=<cardset_name> dnssec-keyfromlabel -l thales-bindtest-ZSK
thales-bindtest.org
```

When prompted, enter your pass phrase. For module protection, press Return.

4   To verify key generation:

-   With 1-of-N OCS protected keys:

```
# pkcs11-list -s 492971158
```

-   With K-of-N OCS protected keys:

```
# preload --module=<module_number> --cardset-name=<cardset_name> pkcs11-list -s 761406613
```

-   With softcard protected keys:

```
# pkcs11-list -s 761406613
```

-   With module protected keys:

```
# pkcs11-list -s 492971157
```

5   When prompted, enter your pass phrase. For module protection, press Return. The key object output should include the following two *thales-bindtest-ZSK* entries:

```
object[0]: handle 1120 class 3 label[19] 'thales-bindtest-ZSK' id[0]
object[1]: handle 1118 class 2 label[19] 'thales-bindtest-ZSK' id[0]
```
